FACT SHEET: Computerized Physician Order Entry
Leapfrog Hospital Survey

Key Facts about Medication Errors

More than one million serious medication errors occur every year in US hospitals. The errors include administration of the wrong drug, drug overdoses, and overlooked drug interactions and allergies. They can occur for many reasons, including illegible handwritten prescriptions and decimal point errors.

Medication errors often have tragic consequences for patients. Many serious medication errors result in preventable adverse drug events (ADEs), approximately 20% of which are life-threatening.

According to the 1999 Institute of Medicine’s report, To Err is Human, medication errors alone contribute to 7,000 deaths annually.

Medication errors also result in tremendous financial costs. One ADE adds more than $2,000 on average to the costs of hospitalization; this translates to over $7.5 billion per year nationwide in hospital costs alone. Furthermore, this figure excludes other important costs of medication errors, such as malpractice insurance premiums and losses in worker productivity.

Effectiveness of CPOE in Reducing Errors

CPOE systems can be remarkably effective in reducing the rate of serious medication errors. A study led by David Bates, MD, Chief of General Medicine at Boston’s Brigham and Women’s Hospital, demonstrated that CPOE reduced error rates by 55% — from 10.7 to 4.9 per 1000 patient-days. Rates of serious medication errors fell by 88% in a subsequent study by the same group. The prevention of errors was attributed to the CPOE system’s structured orders and medication checks. Another study conducted at LDS Hospital in Salt Lake City by David Classen, MD, demonstrated a 70% reduction in antibiotic-related ADEs after implementation of decision support for these drugs.

CPOE has paid other dividends. Length of stay at Wishard Memorial Hospital in Indianapolis fell by 0.9 days, and hospital charges decreased by 13% after implementation of CPOE. A study at Ohio State University also identified substantial reductions in pharmacy, radiology and laboratory turn-around times, and there was a reduction in length of stay in one of the two hospitals studied.

Research estimates that implementation of CPOE systems at all non-rural U.S. hospitals could prevent three million adverse drug events each year.

The Leapfrog CPOE Standard

Given the potential benefits for both patients and payers, national experts in health care quality and

www.leapfroghospitalsurvey.org
patient safety advised The Leapfrog Group to select CPOE as one of its initial safety standards. The Leapfrog Group’s original CPOE standard was based on extensive review of published research and consultation with leading experts in medication errors and CPOE. This standard has since been reviewed and revised, incorporating even more current data and input from the hospital and physician communities.

In order to fully meet The Leapfrog Group’s CPOE standard, hospitals must:

- Assure that physicians enter at least 75% of inpatient medication orders via a computer system that includes prescribing-error prevention software; and
- Demonstrate, via a test, that their inpatient CPOE system can alert physicians to at least 50% of common, serious prescribing errors. (Applies to adult hospitals only.)

The Leapfrog Group invites hospitals to respond to the Leapfrog Group voluntary online survey (https://leapfroghospitalsurvey.org) and share their progress toward meeting Leapfrog’s standard for this practice. Hospitals that have implemented CPOE in at least one inpatient unit will earn partial credit for their progress.

Leapfrog’s CPOE Evaluation Tool

Developed by First Consulting Group and the Institute for Safe Medication Practices, The Leapfrog Group’s CPOE Evaluation Tool provides hospitals with an assessment of the adequacy of their CPOE system alerts for common, serious prescribing errors. The tool requires hospitals to download a series of simulated patients and medication orders, and to input those patient/medication combinations into the hospital’s CPOE system. Hospitals submit a report on the alerts received at point of order-entry. The reported alerts are compared against the expected alerts identified by a national research and development panel. A hospital’s score on the tool is the percentage of correct alerts they received in specific categories. Hospitals are required to test their CPOE system, utilizing the tool, and score well on the test in order to be considered fully implemented for the CPOE Leap.

In the 2013 survey, over 800 adult and general hospitals tested their implementation of CPOE using The Leapfrog Group’s CPOE Evaluation Tool. More information about Leapfrog’s CPOE Evaluation Tool is available at https://leapfroghospitalsurvey.org/cpoe-evaluation-tool/.

Challenges to CPOE Implementation

Despite the considerable benefits, only 8% of US hospitals have fully implemented CPOE systems. What are the challenges?

- The upfront cost of implementing CPOE is one major obstacle for hospitals. At Brigham and Women’s Hospital, the cost of developing and implementing CPOE was approximately $1.9 million, with $500,000 maintenance costs per year since.
- Installation of even “off the shelf” CPOE packages requires a significant amount of customization for each hospital and can be very expensive.
- Finally, there may be cultural obstacles to CPOE implementation. For example, some physicians resist utilizing computerized decision-support tools, relying instead on practice experience.

Why Purchasers Need to Get Involved

Given these obstacles, hospitals may need encouragement from purchasers to implement CPOE. The Leapfrog Group’s purchasers can help www.leapfroghospitalsurvey.org
make the business case for CPOE and help hospitals to understand the potential savings from improved efficiencies. At Brigham and Women’s Hospital, for example, the return on its initial investment has been between $5 and $10 million in annual savings.²

By encouraging and supporting hospitals’ implementation of CPOE, The Leapfrog Group’s purchasers can create the appropriate incentives for hospitals to invest in CPOE. They can accelerate the process by helping to make consumers more aware of the importance of seeking care at hospitals with CPOE systems in place. Finally, The Leapfrog Group’s purchasers’ attention to this safety issue may stimulate CPOE vendors to hasten product improvements and reduce the burden and cost of CPOE implementation.

By getting hospitals to implement CPOE, The Leapfrog Group’s purchasers can leverage major improvements in hospital safety for their employees and other patients.
